

Eighteen pre-registered configurations, by environment

1. Recorded order books

no stable edge; six of fourteen configurations meet the pass rule, a collapsed learner among them

2. Reacting simulator, no injected signal

null — both sealed confirmations fail

3. Reacting simulator with the measured signal

null — both regimes fail

pooled cost vs TWAP (bps) [left of the line = cheaper than TWAP]

Environment 3: the edge was available and the agents left it
