

# Eighteen pre-registered configurations, by environment

## 1. Recorded order books

*no stable edge; six of fourteen configurations meet the pass rule, a collapsed learner among them*

## 2. Reacting simulator, no injected signal

*null — both sealed confirmations fail*

## 3. Reacting simulator with the measured signal

*null — both regimes fail*

pooled cost vs TWAP (bps) [left of the line = cheaper than TWAP]

Environment 3: the edge was available and the agents left it
