

10-second dataset. 50.0% of the episodes before the test period are volatile by construction; the test set is 29.6% (4,559 calm, 1,915 volatile)

same rule, other versions: 1-minute 0.001638, 10-second, shorter episode 0.000891.
A shorter episode spans less time, so its realised volatility, and hence its threshold, is lower
